Other towers + ground spotters observed this object as it was caught by sun going down. Definite silver brilliance easily observed by naked eye. Approx. location over Lake County, Calif. The size of object in relation to setting sun was about  $\frac{1}{8}$ th size of sun.

We checked this object very carefully with field glasses + determined shape to be ~~tear-shaped~~. Distance was too great to catch any details. On sighting same, we set up a ruler on window + sighted over it from a marked point to determine direction + relative speed. Any change was so gradual that nothing was learned from this experiment. One of the two observers had it spotted continue
