SUMMARY OF INFORMATION:

1. On 1 September 1954, information was received by this command to the effect that an unidentified flying object had been sighted at approximately 2039 hours, 24 August 1954, in the vicinity of Egilsstaðir by an individual at _____ in Northeastern Iceland.

2. The eyewitness, who was located approximately 5000 feet from the line of flight of the object, described it as being approximately the length of a man's arm (2 to 2½ feet long), approximately 4 to 5 inches in diameter, cylindrical in shape and dark gray in color. The object, emitting a loud whizzing sound, reportedly crossed the sky from the Northwest and travelled a level course to the Southeast at a rapid rate of speed. The object continued its level flight for some time and then lost speed and fell into a sand-bar in the Lagerfljot River (65°04'N-14°30'W).

3. The person who had witnessed the unidentified object did not reach the impact area until 30 August. Between the time of the sighting and the marking, the Lagerfljot River had risen twice and washed over the sand-bar where the object reportedly landed, altering the size and shape of the sand-bar.

4. After several unsuccessful attempts to reach the location of the sighting, a Defense Force investigating team arrived at the referenced area on 11 September 1954. The reported area of impact, approximately 250 feet by 250 feet, was searched with Mine Detector Set SCR-625 but with negative results. The Detector Set is so constructed as to be effective for only a depth of from 18 to 22 inches. Much of the area was under water at the time of the search, and the soil, lava-sand, is of such consistency as to render any results obtained with the Detector Set erratic at best.

5. Investigation of the reputation of the eyewitness and those individuals reported as having heard the sound disclosed that these persons are considered to be reliable and are of good reputation in the community.

6. Among the possible identities of the reported object are a bird such as the loon, whose flight pattern resembles that described by the eyewitness, a meteor or the tip-tank of an aircraft. There were no Defense Force aircraft in the vicinity of the referenced area during the reported time of sighting.

SUMMARY OF INFORMATION

CONCLUSION: It is the opinion of this command that some object, nature unknown, did land in the vicinity of the referenced area. Because of the constant downstream motion of the river bottom and the condition of the impact area, shifting lava-sand and water, two possibilities present themselves. The entire area could be dug up in an effort to locate the object, but this method, after consideration, was disregarded because of the great expense involved. On the other hand, it is believed that the most practical method of determining the nature of the unidentified object is a device which can detect the presence of buried substances 5 to 6 feet below the surface. Such a device is not available in this command, nor is there one on requisition. Due to the aforementioned condition of the impact area and the river bottom, it is recommended that such a device be furnished this command as soon as possible, if it is felt necessary to locate and identify the object.
